11. One of the diagonals of a rhombus is thrice as the other. If the sum of the length of the diagonals is 24 $cm$, then find the area of the rhombus.

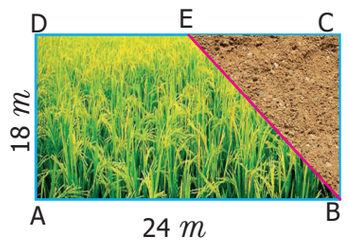

12. A man has to build a rhombus shaped swimming pool. One of the diagonal is 13 $m$ and the other is twice the first one. Then find the area of the swimming pool and also find the cost of cementing the floor at the rate of ₹ 15 per $sq.cm$.

13. Find the height of the parallelogram whose base is four times the height and whose area is 576 $sq.\ cm$.

14. The table top is in the shape of trapezium with measurements given in the figure. Find the cost of the glass used to cover the table at the rate of ₹ 6 per 10 $sq.\ cm$.

15. Arivu has a land ABCD with the measurements given in the figure. If a portion ABED is used for cultivation (where E is the mid-point of DC), find the cultivated area.

## Summary

- Parallelogram is a four sided closed shape in which opposite sides are both parallel and equal.
- Area of the Parallelogram = $b$ x $h$ $sq.\ units$, where $b$ = base ; $h$ = height.
- In a parallelogram if all the sides are equal then it is called Rhombus.
- Area of rhombus = $\frac{1}{2}$ x $d_1$ × $d_2$ $sq.\ units$, where $d_1$, $d_2$ are the diagonals.
- A parallelogram with one pair of non-parallel sides is known as a Trapezium.
- Area of the Trapezium = $\frac{1}{2}$ x $h$ $(a+b)$ $sq.\ units$. Let the distance between the two parallel sides be '$h$' units.
- If the non - parallel sides of a Trapezium are equal then it is known as an isosceles Trapezium.
